Cave 85

SALT SURVEY: East wall: Total content of ionic species per micro-core sampling increment:

EAST WALL

Salt Survey

Micro-core samples were taken from areas of unpainted plaster; each micro-core sample measured approximately 0.5cm in area with samples taken at four depths of 2-3 mm each. Sampling was carried out by the DA between the spring and fall 2002 campaigns. Ion analysis was subsequently carried out at GCI using ion chromatography (IC).
